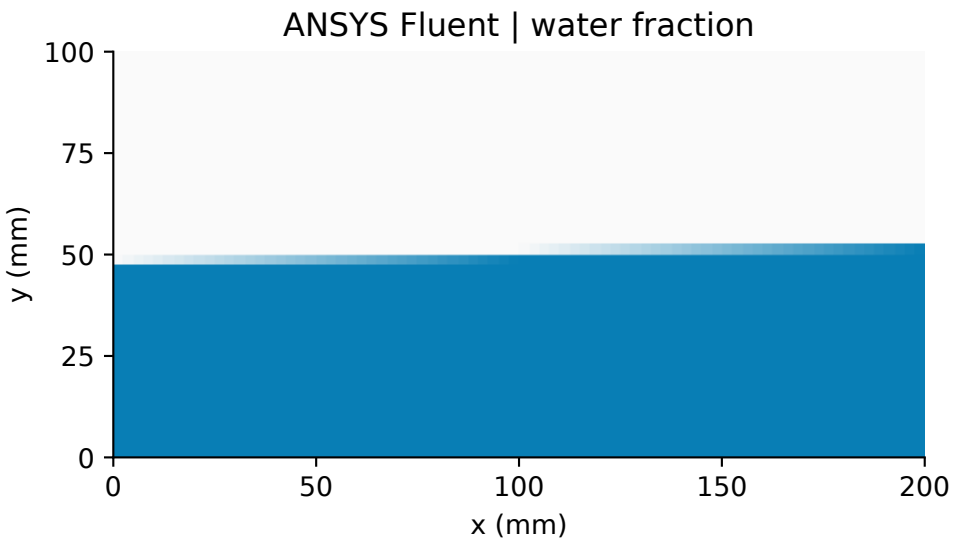
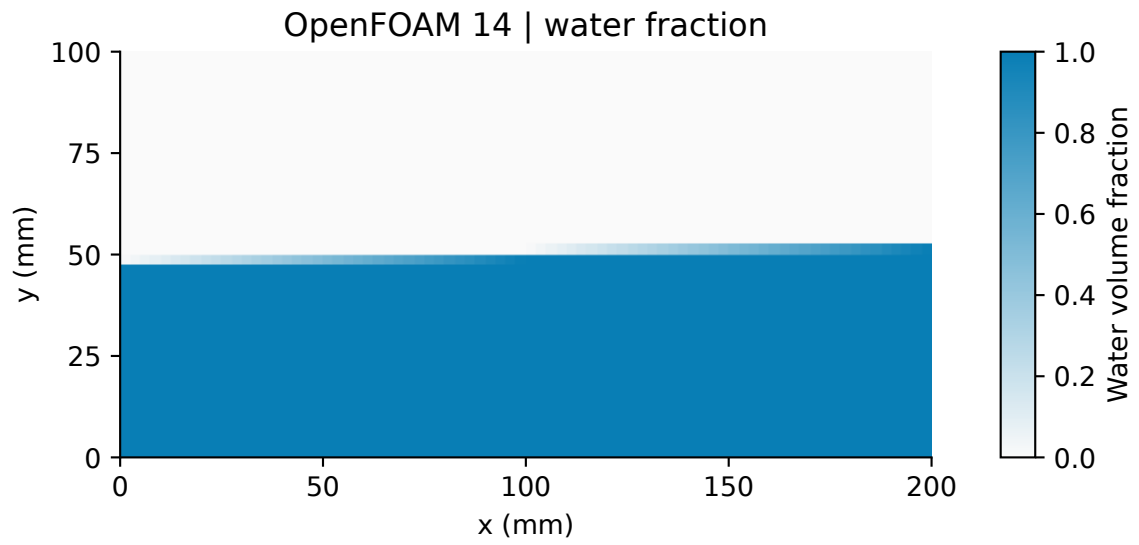
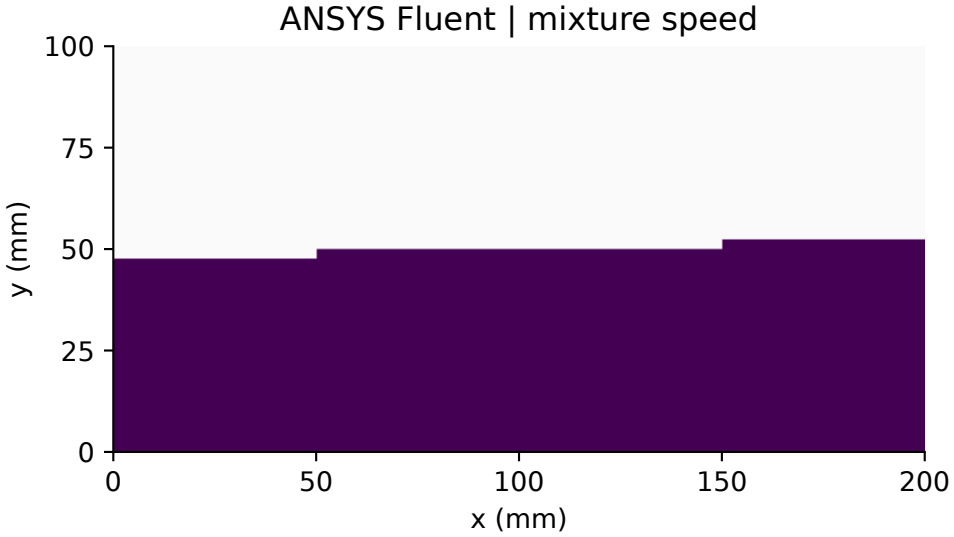
Small-amplitude water-tank sloshing

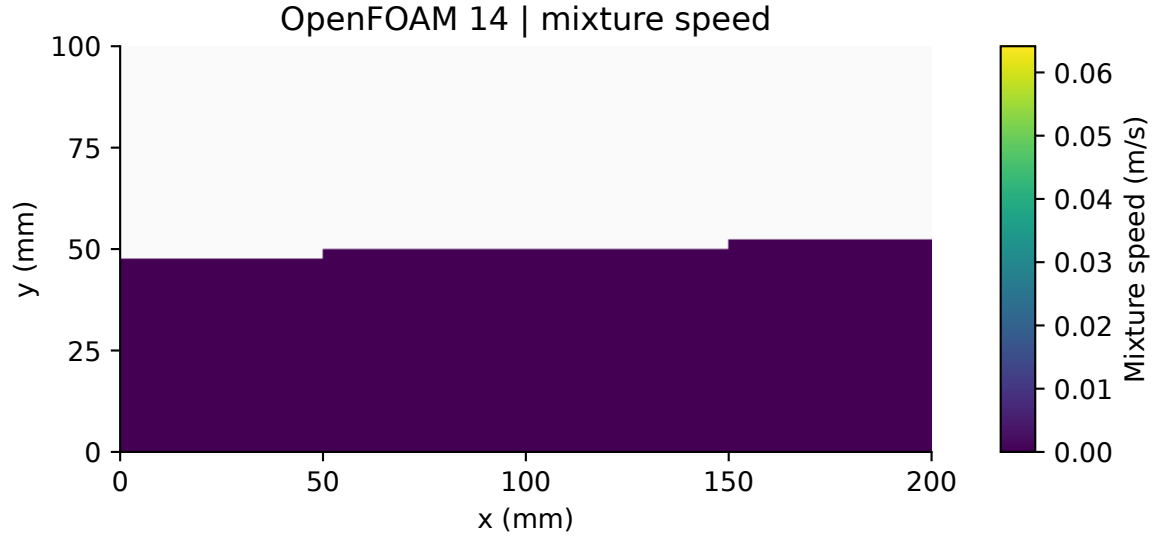
Physical time t = 0.00 s | native step 0000 / 2400

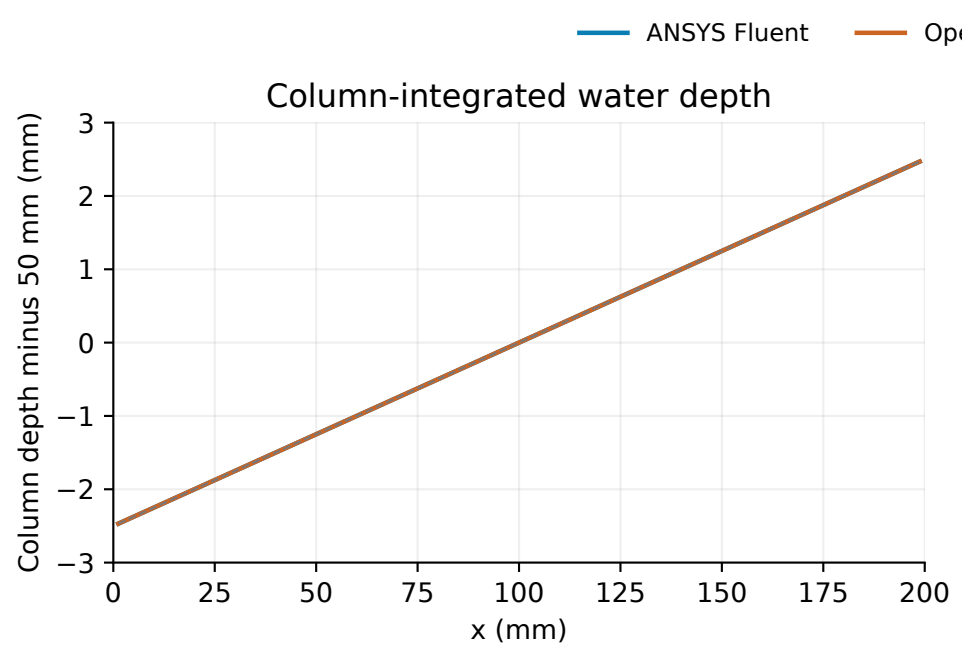
200 x 100 mm tank | 3,200 cells | dt = 0.5 ms | same initial fractions and material properties

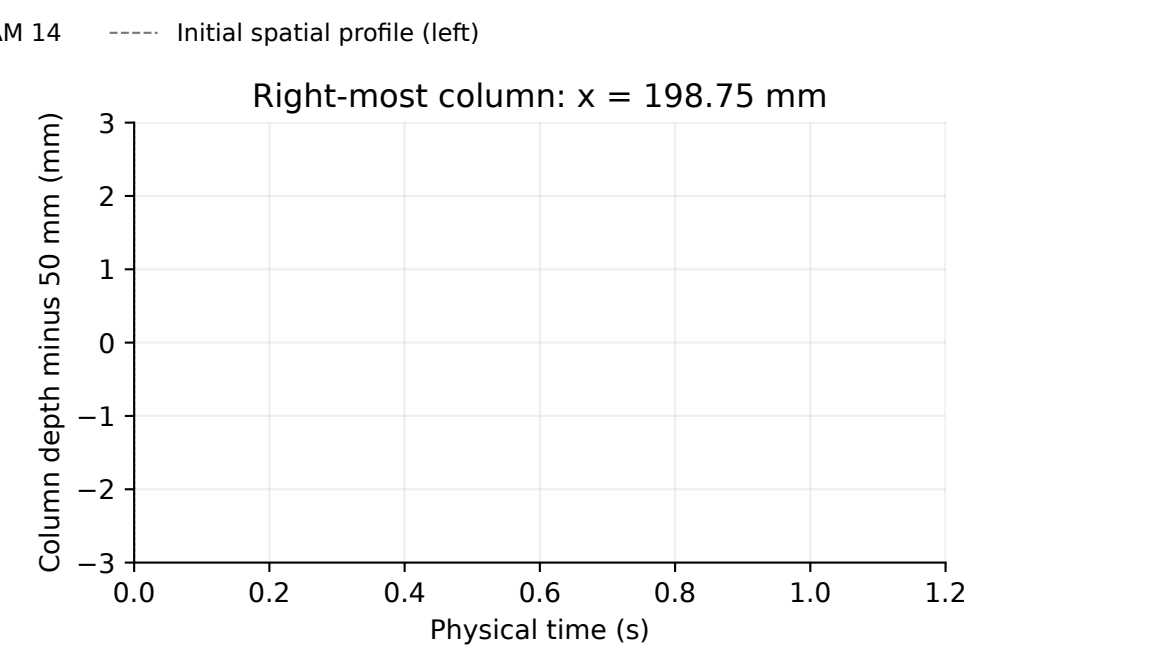












Mixture speed uses water fraction >=0.5; velocity arrows below 0.5% of the common speed scale are hidden.

121 native states, 0.01 s apart, shown at 12 fps. Both numerical audits passed; mesh/time independence and physical validation remain open.
