Dam break | released-column qualification

Actual native t = 0.020 s | 200 steps | 9,072 cells | dt = 0.1 ms

Both short-run numerical audits passed. This 0.02 s qualification is separate from the planned 0.5 s case.

Grey: solid obstacle. Velocity shown only in cells with alpha >=0.5; arrows below 0.5% of the common scale are hidden.

Speed scale is shared between these two actual snapshots; arrows are instantaneous velocity, not particle paths.

Source-bound native fields and clocks checked. These qualification results do not establish physical validation.
